DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Acker et al.'774.

Acker et al.'774 teach a therapeutic ultrasound system, comprising: an ultrasonic transducer for irradiating a therapeutic ultrasound on a region to be treated (col. 3, lines 8-19); and bubble detecting means for detecting a bubble caused in a region exposed with said therapeutic ultrasound during exposure of said therapeutic ultrasound, wherein a setting-up means has a function of setting up a time from detection of the bubble by said bubble detecting means to the end of the exposure of said therapeutic ultrasound (col. 4, lines 39-64; referring to detection of obstacles of the detection time is at a later time than the expected time of detected echo signals and see col. 12, lines 61-67 and col. 13, lines 1-27).

While Acker et al.'774 do not expressly describe a setting-up means for setting up an insonation time of said therapeutic ultrasound, it would have been obvious to one skilled in the art at the time that the invention was made that the time set up is included in the procedure of comparing the expected response versus the actual response, implying that the expected response is predetermined as it relates to the treatment protocol.

Acker et al.'774 further teach a bubble detecting means having means for

detecting an acoustic wave having a frequency at a higher frequency band than the therapeutic ultrasound transmitted from said ultrasonic transducer (see in col. 13, lines 28-39). It would have been obvious to one skilled in the art at the time that the invention was made that the higher frequency band would include twice the therapeutic ultrasound frequency.

Acker et al.'774 further teach means for generating an alarm when received signal intensity of harmonics of said therapeutic ultrasound reaches a set value or more (see col. 13, lines 21-24).
